In addition, Compliance Manager supports RACF, ACF2, TSS, and z/Linux.

Key Features:

- Budget sensitive.

- Performs critical compliance checks

- Performs custom baseline checks

- Easy-to-use with immediate results

- Identifies open compliance gaps and remediates

Virtel

VANGUARD Compliance Manager ™

Many of the offerings today require the user/company to accept "out of the box" offerings that may or may not fit exact personality of the organization. Trying to make a square peg fit into a round hole leaves many gaps that could create audit and compliance issues for the organization.

The Vanguard solution requires organizations to leverage «subject matter experts» that identify specific and unique checks deemed important for meeting and exceeding both internal and external regulatory / audit requirements.

How it works:

Upon the completion of the check definition by the SME, the definitions are delivered to the Vanguard Compliance Manager team for refining, which produces unique client specific baseline checks.
The process of creating unique specific base-lines for the industry segment and personalizing by organization is the best method for receiving anticipated ROI for security and compliance investments.

Vanguard Compliance Manager provides an "easy-to-use" communication layer that delivers immediate results for "C" level intelligence, validating data protection results and guidance for corporate protection and compliance.

Check results and close gaps on all of your organizations workstations, mobile devices and tablets with Vanguard Compli-ance Manager.

Today's executive CISO and CIO demand easy to understand information delivered in handheld device, tablet or business workstation. The Vanguard Compliance Manager delivers timely, important information for intelli-gent decision making to check results and close gaps before they become expensive issues.

For CISOs

Vanguard Integrity Professional has attended the Global CISO Evanta since its inception and first event in Aspen Colorado September 9th to 11th, 2013.
Since then there have been 3,463 significant breaches with major corporations and a loss of 9,740,567,988 records.

Companies face mounting internal and external cyber threats, therefore status of the chief information security officer (CISO) role is critical.
Today's CISO needs to stay current with the threat landscape and the technologies used to defend corporate assets.
The CISO must also communicate with stakeholders and corporate boards, putting those threats into a business context.

CISOs are under constant pressure to create strategies to deploy IT security hardware and software under budget and on time that meet or exceed corporate security policies, standards and procedures.
In addition, they manage the downward pressure from the board, side pressures of both the internal and external auditors while working with senior management to make sure that IT security policies are deployed, revised, sustained, and overseen effectively.
